Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                        honey bee. It is used in the construction of recombinant protein concrine. The recombinant protein construction of recombinant protein concrine. The recombinant protein comprises, melitth signal peptide, vaccine. The recombinant protein comprises, melitth signal peptide, this) fag, T-cell epitope from tetanus toxoid and 21 antigenic epitopes from circumsporozoite protein (CSP), sporozoite surface protein-2 (SSP-2), liver stage antigen-1 (LSA-1), merozoite surface protein-1 (MSP-1), merozoite surface protein-1 (MSP-1), merozoite surface protein-1 specific antigen-175 (EBA-175), rhoptry associated protein-1 (RAP-1) and gamete specific antigen, Pfg27. These epitopes were obtained at different stages of the life cycle of P. falciparum. CDC/NIIMALVAC-1 vaccine has antiparasitic activity and can used for treatment and prevention of malarial infections. Anti-CDC/NIIMALVAC-1 antibodies can be used for detecting P. falciparum in biological samples.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Recombinant protein; CDC/NIIMALVAC-1; multivalent; malaria; vaccine; T-cell epitope; tetanus toxoid; antigenic epitope; treatment; SSP-2; circumsporozoite protein; CSP; sporozoite surface protein-1; SSP-2; liver stage antigen-1; LSA-1; merozoite surface protein-1; MSP-1; MSP-2; apical membrane antigen-1; AMA-1; erythrocyte binding antigen-175; EBA-175; rhoptry associated protein-1; RAP-1; gamete specific antigen; Pfg27; antiparasitic; prevention; anti-CDC/NIIMALVAC-1 antibody;

```
The present sequence is that of recombinant protein CDC/NIIMALVAC-1, which is a multivalent, multistage malarial vaccine. The recombinant protein comprises, melittin signal peptide, (His)6 tag, T-cell epitope protein comprises, melittin signal peptide, (His)6 tag, T-cell epitope from tetanus toxoid and 21 antigenic epitopes from circumsporczoite cfrom tetanus toxoid and 21 antigenic protein. (SSP-2), liver stage cantigen-1 (LSA-1), merozoite surface protein-1 (MSP-1), MSP-2, apical compared antigenil (MAM-1), erythrocyte binding antigenily (FBA-175), reportry associated protein-1 (RAP-1) and gamete specific antigen, Pfg27. These epitopes were obtained at different stages of the life cycle of plasmodium falciparum. CDC/NIIMALVAC-1 vaccine has antiparasitic activity and can used for treatment and prevention of malarial infections. Anti-CDC/NIIMALVAC-1 antibodies can be used for detecting infections. Anti-CDC/NIIMALVAC-1 antibodies can be used for detecting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           VEGF-X; vascular endothelial growth factor; human; vulnerary; cytostatic; antirheumatic; antiarthritic; antipsoriatic; antidiabetic; treatment; angiogenesis regulator; vascularization regulator; cancer; psoriasis; rheumaticid arthritis; diabetic retinopathy; blood vessel; organ repair; tissue regeneration; tissue repair; wound; dermal ulcer; pressure sore; venous sore; diabetic ulcer; burns; skin graft growth.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention describes a novel vascular endothelial growth factor-X (VEGF-X) protein (Ia) and its encoding polynucleotide (IIa) which has vulnerary, cytostatic, antirheumatic, antiantitic, antiporiatic and antidiabletic activity and acts as an angiogenesis and vascularization antidiabletic activity and acts as an angiogenesis and vascularization or preventing cancer, rheumatoid arthritis, psoriasis and diabetic retinopathy by inhibiting angiogenic activity or inappropriate vascularization including formation and proliferation of new blood vascularisation including formation and proliferation of new blood and tissue repair in a subject. The products of the invention are useful for preparing medicaments for treating wounds such as dermal ulcers, pressure sores, venous sores, diabetic uncers and burns and to promote skin graft growth, tissue repair, proliferation of new blood vessels, tissue regeneration and organ repair, proliferation of new blood vessels, tissue regeneration. This sequence represents a human VEGF-X protein which can be expressed in Baculovirus/insect cell systems and which is
                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            VEGF-X; vascular endothelial growth factor; human; vulnerary; cytostatic; antirheumatic; antiarthritic; antipsoriatic; antidiabetic; treatment; andiogenesis regulator; vascularization regulator; cancer; psoriasis; rheumatoid arthritis; diabetic retinopathy; blood vessel; organ repair; tissue regeneration; tissue repair; wound; dermal ulcer; pressure sore; venous sore; diabetic ulcer; burns; skin graft growth.
                                                            New vascular endothelial growth factor protein, useful for treating or preventing diseases associated with inappropriate angiogenesis activity such as cancer, rheumatoid arthritis, psoriasis and wounds -

(VEGE-X) protein (13) and its encoding polynucleotide [13] which has vulnerary, cytostatic, antirheumatic, antiarthritic, antipsoriatic and antidabetic activity and acts as an angiogenesis and vasculatic and regulator. An antisense molecule of the invention is useful for treating or preventing cancer, rheumatoid arthritis, psoriasis and diabetic cretinopathy by inhibiting angiogenic activity or inappropriate cascularization including formation and proliferation of new blood vessels, growth and development of tissues, tissue regeneration and organ at tissue repair in a subject. The products of the invention are useful for preparing medicaments for treating wounds such as dermal ulcers, pressure sores, venous sores, diabetic ulcers and burns and to promote skin graft growth, tissue repair, proliferation of new blood vessels, tissue regeneration and organ repair, proliferation of new blood vessels, tissue regeneration and organ repair by promoting angiogenic activity or vascularization. This sequence represents a human VEGE-X protein which can be expressed in E. coli systems and which is described in the method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

The present invention relates to vaccine for prevention and/or prophylaxis of infectious salmon anaemia in fish. The invention prophylaxis of infectious salmon anaemia in fish. The invention provides for nucleic acid sequence encoding viral proteins of infectious salmon anaemia virus (ISAV) as well as the isolated protein. Nucleic acids encoding viral protein is useful for the manufacture of a DNA vaccine for diagnosis, treatment and/or prophylaxis of infectious salmon anaemia in fish, and viral protein can be used for the manufacture of antibodies that are specific for ISAV. The present sequence is infectious salmon anaemia virus 92-M fusion protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   UGGT; UDP-glucose:glycoprotein glucosyltransferase; enzyme; honeybee; melittin signal peptide.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        QΩ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        δλ
                                                                                                                                                                                                                                                                                                                The present sequence represents a fusion protein from an example of the present invention which describes human telomerase reverse transcriptase (hTRT). The present invention also describes the transcriptase (hTRT). The present invention also describes the following methods: (A) determining whether a test compound is a modulator of hTRT, by detecting the change in hTRT recombinant protein or polynuclectide, on administration of the compound; protein or polynuclectide, on administration of the compound; protein or protein in a sample by binding a relevant of the hTRT RNA or protein in a sample by binding a relevant of the hTRT RNA or protein in a sample by binding a relevant of the hTRT RNA or protein in a sample by binding a relevant of the sample and detecting the complex formed or in the case of RNA detection, amplification product with presence of hTRT in the sample; and (D) increasing the proliferation of a vertebrate cell by increasing hTRT expression; and (B) the use of an agent that causes an increase in cell vertebrate cell proliferation to create a medicament that inhibits ageing. A protein preparation of hTRT and the polynuclectide encoding hTRT can be used in the manufacture of medicaments for inhibiting the effect of ageing or cancer. Inhibitors of tellomerase activity can be used to treat conditions that are associated with high tellomerase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0;

interleukin-10 (IL-10) and is assumed to be a cytokine. It can be used in the regulation of cell proliferation and differentiation, haematopoiesis, immune stimulation or suppression, tissue growth and tumour inhibition. In addition, it also has uses in the treatment of inflammation and in nutrition.
                                                                                                        Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                              The present invention relates to a method for determining the effect of a test sample on UDP-glucose:glycoprotein glucosyltransferase (UGGT) activity. The method comprises exposing an acceptor substrate for UGGT to a labelled donor in the presence of the test sample and UGGT. The method is useful for determining UGGT activity. In particular, the method is useful for determining UGGT activity. In particular, the method is useful in glucosyltransferase assay and kinetics measurement for reticulum which catalyses the addition of a glucose residue onto asparagine-linked oligosaccharides, which are present on incorrectly folded glycoproteins. The present sequence is the honeybee melittin signal peptide. This sequence was used in the construction of an expression vector for rat UGGT (see AAF60732 and AAB72436).
                                                                      ü
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention provides the protein and coding sequences for the novel human GIL-19/AE289 protein. The protein shows homology to
                              Determining the effect of a test sample on UDP-glucose.glycoprotein glucosyltransferase (UGGT), useful for measuring UGGT activity, comprises exposing an acceptor substrate for UGGT to a labeled donor the presence of UGGT.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         (interleukin)-10, useful in upregulation of humoral immune responses, as an antlinflammatory agent and as a modulator of immune responses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

Blocks the MHC class II pathway. The US2 protein does not have to be mutated to cause inhibition of the MHC class II pathway. The binding domain recognizes MHC I heavy chains, MHC II alpha
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       S

The present sequence is the honey bee (Apis melifica) melittin excretion peptide. It may be used in the Aedes aegypti Densonucleosis virus (AeDNV) based vectors of the invention to aid vector propagation, isolation and subcloning. AeDNV based vectors, esp. confg. the p61, p0.5 and p7 promoters are useful for targeting heterologous proteins to the
chains, and optionally DM-alpha chains. US2 has a double inhibitory chains, on the MHC class II pathway, inhibiting recognition of cellular tissue by CDB-positive and CD4-positive T cells. US2 or its soluble variants, can be used to reduce inappropriate immune responses. The US2 protein can be used to improve the persistence of a virus. Vectors encoding soluble US2 protein (residues 28-143) can be used to improve the persistence of a virus. Vectors autoimmune disease, especially where it is mediated by MHC II molecules. The vector can also be used to improve gene therapy, and preferably also contains a sequence encoding a therapeutic product. The protein is exogenously supplied or expressed from a recombinant cell, and may also be used to inhibit CD4-positive mediated immune responses, transplant immune responses and gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       expression system; promoter; p61; p0.5; p7; heterologous protein; production; vector; cassette.

The invention relates to the use of a Aedes aegypti densonucleosis virus (AeDNV) as a heterologous gene expression system. A recombinant protein using the vectors of the invention can be produced by a method that comprises (1) transfecting an insect cell that stably expresses AeDNV comprises (1) transfecting an insect cell that stably expresses AeDNV structural proteins vpl and vp2 with an expression comprising the comprising an AeDNV promoter linked to a sequence coding for the protein comprising an AeDNV promoter linked to a sequence coding for the protein and with an expression vector comprising the AeDNV nonstructural proteins NSI and NS2 encoding genes; (2) obtaining infectious virions from the transfected cell; (3) infecting a second insect cell with the virions; culturing the second cell under conditions such that the protein is expressed, and (4) recovering the protein from the second cell under conditions from the second cell. Aedes albopictus Cépás cells can be transfected with AeDNV vectors without allocations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               cytopathic effects. The present sequence represents a honey bee cytopathic effects. This signal peptide can be used in the AeDNV mellitin excretion peptide. This signal peptide can be used in the AeDNV expression vectors for secretion or nuclear localisation.
                                                                                                                                                                                                                                                      AeDNV; Aedes DNV; densonucleosis virus; gene expression; recombinant; structural protein; VP1; VP2; promoter; nonstructural protein; NS1; NS2; virion; transfection; cytopathic; honey bee; excretion peptide.

                                                                                                                                                                                                                                                                                                                                                                                       This sequence represents a secretion signal from the plasmid pMelBac which is used in a method involving the construction of a target molecule from human J chain protein fragments. This construct is used in a method to target imaging agents to epithelial surfaces at which they may remain or undergo transeptthelial transport via transcytosis. At least one imaging agent is linked to the targeting molecule comprising a polypeptide that (a) forms a closed covalent loop, (b) contains at least 3, preferably 4, peptide domains having beta-sheet character separated by domains lacking beta-sheet character and (c) is not full length dimeric 19A. The imaging agents are useful in the diagnosis of disease. The target molecule is also capable of specifically binding to a basolateral factor associated with an epithelial surface to cause internalisation of a biological agent linked to the target molecule.

The secretion signal and multiple cloning site are used in the assembly of a targeting molecule (TM). The TMs are used to target biological agents to epithelial surfaces at which they can be internalised. The TMs comprise a polypeptide that: (a) forms a closed covalent loop; (b) contains at least 3, preferably 4, peptide domains having beta-sheet character separated by domains lacking beta-sheet character; and (c) is not full length dimeric IgA. The TMs are useful to prevent and/or treat diseases associated with epithelial surfaces, e.g. asthma, cancer, (myco)bacterial, viral or fungal infection, inflammatory disorders, autoimmune disorders, celiac disease, colitis, pneumonia and cystic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              epithelial cell; cancer; treatment; therapy;
non-small cell lung carcinoma; breast carcinoma;
ovarian carcinoma; prostate carcinoma; endometriosis;
viral infection; inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Targeting molecule; J chain; immunoglobulin; IgM; IgA; substrate;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ï
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Length 26;

This polypeptide comprises the major antigen protein 2 gene (MAP2) of Ehrlichia canis. It is encoded by the MAP2 gene (see AAV07181). A claimed composition comprises a nucleic acid (see AAV07184). encoding a polypeptide (see AMV87188-99) that elicits a protective immune response against a rickettsial pathogen. The nucleic acid is used, in human or veterinary medicine, in vaccines to protect against Rickettsia, Ehrlichia, Anaplasma and Cowdria species. The nucleic acid dose not replicate in the host but remains episomal and capable of expressing polypeptide for at least 19 mth. The Ehrlichia antigenic polypeptides can also be used diagnostically to detect antibodies associated with Ehrlichia infection (claimed).
                                                                                                                                                                         Composition containing nucleic acid encoding rickettsial antigen useful for, e.g. stimulating protective immune response in humans or

                                                                                                                                                                                                                                                                                                                                                                                                          cells, particularly for delivery of enzymes, binding agents, inhibitors, nucleic acids, carbohydrates and lipids, is new.

The targeting agent comprises a polypeptide which forms a closed covalent loop and contains a least three peptide domains having covalent loop and contains. The targeting molecule preferably lacking beta-sheet character. The targeting molecule preferably comprises all or a portion of a native J chain sequence. J chain comprises all or a portion of a native J chain sequence. J chain comprises all or a portion of a native J chain sequence. J chain comprises all or a portion of an entire J chain sequence. J chain composition of at least one biological agent which is capable of entering and the propolarised epithelial cell. The targeting molecule may be linked to the biological agent by a substrate for an intracellular or extracellular enzyme which is associated with or intracellular encounted by the non-polarised target cell. The targeting molecule can be used in a pharmaceutical composition for treating a patient carlinoma and endometricals composition for treating a patient carlinoma and endometricals, viral infection or inflammatory carcinoma, continummatory construction of target molecules described.

Patent No. 6251392
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Hiatt, Andrew C.
APPLICANT: Fitchen, John H.
TITLE OF INVENTION: NOVEL EPITHELIAL CELL TARGETING AGENT NUMBER OF SEQUENCES: 89
CORRESPONDENCE ADDRESS:
             APPLICANT: Fitchen, John H.
TITLE OF INVENTION: NOVEL EPITHELIAL TISSUE IMAGING AGENT
NUMBER OF SEQUENCES: 93
CORRESPONDENCE ADDRESS:
ADDRESSEE: SEED and BERRY LLP
STREET: 6300 Columbia Center, 701 Fifth Avenue
CITY: Seatile
STATE: Washington
                                                                                                                                                                                                                                                               COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.30
CURRENT APPLICATION DATE: US/08/782,480
FILING DATE: 10-JAN-1997
CLASSIFICATION: 435

Recombinant vaccine CDC/NIIMALVAC-1.
Recombinant protein; CDC/NIIMALVAC-1; multivalent; malaria; vaccine;
T-cell epitope; tetanus toxoid; antigenic epitope; treatment;
circumsporozoite protein; CSP; sporozoite surface protein-2; SSP-2;
liver stage antigen-1; LSA-1; merozoite surface protein-1; MSP-1; MSP-2;
apical membrane antigen-1; AMA-1; erythrocyte binding antigen-175;
EBA-175; rhoptry associated protein-1; RAP-1; gamete specific antigen;
Pfg27; antiparasitic; prevention; anti-CDC/NIIMALVAC-1 antibody;
honey bee.
Chimeric - Apis sp.
Chimeric - Clostridium tetani.
Chimeric - Plasmodium falciparum.
Key Location/Qualifiers
Peptide 1.,22
/note= "Derived from Honey bee"
Protein 23350
/label= Mature_CDC/NIIMALVAC-1
/note= "Recombinant multivalent malarial vaccine"

19-AUG-1999;

```
The polypeptide is prepd. by genetic engineering of genes encoding the P. falciparum circumsporozoite (CS) protein [Dame et al., Science 225: 593 (1984)], and the influenza virus non-structural protein [NSI), [Baze et al., Nucleic Acids Research, 8: 5845 (1980)]. The DNA encoding the 1st 81 AAS of the N-terminal of NSI (1980)]. The DNA encoding the 1st 81 AAS of the N-terminal of NSI (NSI_81) is linked via a synthetic sequence to DNA encoding Region turn is fused to DNA encoding Region [I.contg. flanking regionless the 18 AA signal region, which in turn is fused to DNA encoding Region II.contg. flanking region sess the first nine N-terminal AAS. This CS fusion is designated REIGeltage. The PTO residue separating the ASP (at the C-terminal of the linker) from Rifeltage is an artifact of a filled in BamHI site. The peptide can be used in a vaccine for protection against
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Polypeptide comprising immunogenic determinants from P falciparum - for vaccine against malaria infection in humans.

the P. falciparum circumsporozoite (CS) protein | Dame et al.,

Science 225: 593 (1984), and the influenza virus non-structural

Science 225: 593 (1984), and the influenza virus non-structural

protein 1 (NSI), | Baez et al., Nucleic Acids Research, 8 : 5845

(1980)]. The DNA encoding the 1st 81 AAs of the N-terminal of NSI

(NSI,81) is linked via a synthetic sequence to DNA encoding Region

I contg. flanking regionless the 18 AA signal region, which in

turn is fused to DNA encoding Region II-contg. flanking region.

C This CS fusion is designated REfAuth. The Pro residue separating

the Asp (at the C-terminal of the linker) from REfAuth is an arti-
fact of a filled in Bamil site; the Gly separating Region I and

C Region II-contg. CS flanking regions is an artifact of a synthetic

FORI/TATHII I linker. The peptide can be used in a vaccine for

protection against malaria.

The complete nucleotide and AA sequences are given in EP-304720,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The polypeptide is prepd. by genetic engineering of genes encoding

The polypeptide is prepd. by genetic engineering of genes encoding the P. falciparum circumsporozoite (CS) protein [Dame et al., ct the P. falciparum circumsporozoite (CS) protein [Dame et al., ct science 225 : 593 (1984)], and the influenza virus non-structural protein 1 (NS1), [Baez et al., Nucleic Acids Research, 8 : 5845 (1880)]. The DNA encoding the 1st 81 AAs of the N-terminal of NS1 (NS1_81) is linked to a synthetic sequence encoding four repeat units from the immunodominant region, which in turn is linked via a synthetic sequence to DNA encoding Region I contg. flanking region This is linked to DNA capton Is so the CS flanking region in The Pro residue septore arating the Asp (at the C-terminal of the linker) from the Region creding the Asp (at the C-terminal of the linker) from the Region of I-contg. CS flanking region is an artifact of a filled-in BamHI creding the Gly separating the Region I and II-contg. CS flanking region in a vaccine for protection against malaria. See also AAR12306-R12311 and AAR13175-R13179.

The polypeptide is prepd. by genetic engineering of genes encoding the P. falciparum circumsporozoite (CS) protein [Dame et al., Science 225: 593 (1984)], and the influenza virus non-structural protein 1 (NS1), [Baez et al., Nucleic Acids Research, 8: 5845 (1980)]. The DNA encoding the 1st 81 AAs of the N-terminal of NS1 (NS1_81) is linked via a synthetic sequence to DNA encoding Region I contg. flanking region less the 18 AA signal region. This is linked to a synthetic sequence encoding two repeat units from the immunodominant region, which in turn is fused to DNA encoding Region II-contg. flanking region. The Pro residue separating the Asp (at the C-terminal of the linker) from the Region I-contg. CS flanking region is an artifact of a filled-in Bamil site; the Gly separating the repeat units and the Region II-contg. CS flanking region is an artifact of a synthetic FOKI/TthIII I linker. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Polypeptide comprising immunogenic determinants from P falciparum - for vaccine against malaria infection in humans.

The non-natural variants have reduced affinity for at least 1 antibody capable of blocking a second antibody that inhibits the proteolytic cleavage of plasmodium MSP-1_4_2, and has the same affinity for at least one third antibody that inhibits the proteolytic cleavage of plasmodium MSP-1_1_1. The non-natural variants of the present invention are useful for immunising a mammal against malaria, and can be used to treat malaria. The present sequence is MSP-119 protein.

Sequence of the CS gene (AAN81108) is from lambda-mPfl. A recombinant DNA molecule is claimed, comprising functional DNA coding sequence fused, in phase, to a portion of the Pre-S2 region of a hepatitis B virus (HBV) Pre-S2-S protein coding sequence. The functional DNA coding sequence comprises the Pre-S2 coding sequence, Pre-S1 coding sequence or entire Pre-S1-Pre-S2 coding sequence, the CS protein coding sequence of Plasmodium, or a HIV coding sequence such as an HIV envelope gene sequence, e.g. HIV C7 protein coding region, HIV Peptide 121 coding region, or HIV Dreesman peptide coding region.

Peptide antigens may be synthesised in pure form and used to generate an immune response in vaccination against malaria. The featured repeat units are claimed and must be present in Ropies of 2-1000.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New immunologically active pure synthetic peptide(s) - used for protection against infection by malaria parasite.

Plasmid WR201 was obtained from the Walter Reed Army Institute of
Research, and results from insertion of a 2.3 kb EcoRI fragment from
lambda mpfl encoding the complete CS protein gene P. falciparum into
vector pUCB. A recombinant DNA vector is claimed, which comprises a DNA
sequence contg. the coding sequence of the CS P. falciparum operatively
linked to an expression control sequence. Prefd. expression control
sequences include the yeast glyceraldehydrogenase gene (TDH3)
promoter and the yeast ornithine carbamoyl transferase gene (TDH3)
promoter and the yeast ornithine carbamoyl transferase gene (TDH3)
promoter and the yeast ornithine carbamoyl transferase gene (TDH3)
promoter and the yeast ornithine carbamoyl transferase gene (TDH3)
promoter and the yeast ornithine carbamoyl transferase gene (TDH3)
promoter and the yeast ornithine carbamoyl transferase gene (TDH3)
promoter and the yeast ornithing its first 50bp. Also claimed is a
transformed host cell, a method of culturing the cell to produce CS, the
protein and a vaccine. The vector comprises a 192 bp Sau3A fragment
coding for 16 tetrapeptide repeats of the P. falciparum CS protein
derived from Sau3A digestion of a 1215 bp StuI-RsaI fragment of WR201
containing the P. falciparum CS protein coding sequence minus
approx. its first 50 bp, or two, three, four or more tandem copies of
such 192 bp Sau3A fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Expression of P. falciparum circumsporozoite protein by yeast using recombinant DNA vector having coding sequence linked to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Example 1; Fig 2a; 44pp; English.
